# Math-Symbols-in-LATEX-Manual

#### polossk

Version: v2.2.3.1026, Last Update: October 26, 2022

Add \usepackage{math-symbols} in your document's preamble. And you will no longer need use other math package in most instances.

### 1 Constants and Useful Symbols

```
i
                                    \mathbb{C}
                                                                                           L^m([a,b])
                                                                                                          \mslbg[{[a, b]}]{m}
      \mi
                  \mathbb{N}
                        \mnatr
                                               \mcmpx
                                                            C[a,b]
                                                                       \mscab
                                                                                          H^m([a,b])
                                                            C(I)
                                                                                                          \mssbl[{[a, b]}]{m}

                                                 \conv
                                                           argopt
                                                                      \argopt
                                                                                           \divergence
```

#### 4 Useful Aliases and Generators

• Derivatives. Command: \[d]frac(diff|partial)(s|{var1}){var2}. var1 and var2 is numerator and denominator, respectively. [d] is just like the \dfrac providing a display mode. (diff|partial) provides derivative or partial derivative. (s|{var1}) means that the numerator is skippable. For example,

Text	$T_{ m E}X$	Text	$T_{E}X$
$\frac{\mathrm{d}u}{\mathrm{d}x}$	\fracdiff{u}{x}	$\frac{\mathrm{d}u}{\mathrm{d}x}$	\dfracdiff{u}{x}
$\frac{\mathrm{d}^2 u}{\mathrm{d}x^2}$	$\frac{2u}{x^2}$	$\frac{\mathrm{d}^2 u}{\mathrm{d}x^2}$	lem:lem:lem:lem:lem:lem:lem:lem:lem:lem:
$\frac{\mathrm{d}}{\mathrm{d}x}$	\fracdiffs{x}	$\frac{\mathrm{d}}{\mathrm{d}x}$	\dfracdiffs{x}
$\frac{\partial u}{\partial x}$	\fracpartial{u}{x}	$\frac{\partial u}{\partial x}$	$\dfracpartial{u}{x}$
$\frac{\partial^2 u}{\partial x^2}$	$\frac{^2u}{x^2}$	$\frac{\partial^2 u}{\partial x^2}$	$\dfracpartial {^2u} {x^2}$
$\frac{\partial}{\partial x}$	\fracpartials{x}	$\frac{\partial}{\partial x}$	\dfracpartials{x}

- Function vaules at exact point. Command: \mfwhen{\var1}{\var2}. var1 and var2 is function and point position, respectively. For example, \mfwhen{\fracpartial{u}{t}}{x=5} gets  $\frac{\partial u}{\partial t}|_{x=5}$ .
- Auto sized brackets. Command: \mclosure{} for (), \mclosuresquare{} for [], \mclosurebrace{} for {}. For example,  $\left\{\left[\left(a^2+b^2\right)^2\right]^3\right\}$ .
- Vector(Sequence) generator. Command \mvct[z][t]{var1}{var2}. var1 and var2 is variable name and the last index, respectively. The index is begin from 1 in default. [z] makes index begins from 0. [t] makes this vector transposed into a column vector. For example,

Text	T <sub>E</sub> X	Text	TEX
$(a_1, a_2, \dots, a_n)$	$\mbox{mvct}\{a\}\{n\}$	$(a_0,a_1,\ldots,a_n)$	\mvctz{a}{n}
$(a_1, a_2, \ldots, a_n)^{\mathrm{T}}$	$\mbox{mvctt{a}{n}}$	$(a_0, a_1, \ldots, a_n)^{\mathrm{T}}$	$mvctzt\{a\}\{n\}$

• A list of equations group by a brace. Command \mequlist{\ldots}. \ldots\. Also provide environment equlist, which is similar with the cases environment. For example, \mequlist{x + y &= 10 \\ 4x + 2y &= 30} \\ \frac{x + y = 10}{4x + 2y = 30}.
