Math-Symbols-in-LATEX-Manual

polossk

Version: v2.2.2.0414, Last Update: April 14, 2022

Add \usepackage{math-symbols} in your document's preamble.

And you will no longer need use other math package in most instances.

1 Constants and Useful Symbols

```
\mathbb{C}
                                                                                         L^m([a,b])
i
                 \mathbb{N}
                       \mnatr
                                                           C[a,b]
      \mi
                                              \mcmpx
                                                                                                        \mslbg[{[a, b]}]{m}
                                                                      \mscab
                                                                                         H^m([a,b])
                                              \mhilb
                                                           C(I)
                  \mathbb{Z}
                                   \mathbb{H}
                                                                                                        \mssbl[{[a, b]}]{m}
j
      \mj
                       \mintg
                                                                      \mbox{mscon}\{(I)\}
                                                           L^2(I)
e
      \me
                  0
                       \mrato
                                   Cond.
                                              \mcond
                                                                      \mslbg{2}

3 Useful Functions and Operators

d	\diff	eig	\eig	mean	\mean	card	\card	dist	\dist
D	\Diff	tr	\tr	var	\var	argmin	\argmin	rot	\rot
\mathbf{E}	\Expect	lcm	\l cm	corr	\corr	argmax	\argmax	curl	\curl
diag	\diag	rand	\rand	conv	\conv	argopt	\argopt	div	\divergence

4 Useful Aliases and Generators

• Derivatives. Command: \[d]frac(diff|partial)(s|{var1}){var2}. var1 and var2 is numerator and denominator, respectively. [d] is just like the \dfrac providing a display mode. (diff|partial) provides derivative or partial derivative. (s|{var1}) means that the numerator is skippable. For example,

Text	$T_E X$	Text	T_EX
$\frac{\mathrm{d}u}{\mathrm{d}x}$	\fracdiff{u}{x}	$\frac{\mathrm{d}u}{\mathrm{d}x}$	\dfracdiff{u}{x}
$\frac{\mathrm{d}^2 u}{\mathrm{d}x^2}$	$\frac{2u}{x^2}$	$\frac{\mathrm{d}^2 u}{\mathrm{d}x^2}$	$\dfracdiff{^2u}{x^2}$
$\frac{\mathrm{d}}{\mathrm{d}x}$	\fracdiffs{x}	$\frac{\mathrm{d}}{\mathrm{d}x}$	\dfracdiffs{x}
$\frac{\partial u}{\partial x}$	$\frac{u}{x}$	$\frac{\partial u}{\partial x}$	$\label{lem:def} $$ \dfracpartial\{u\}\{x\} $$$
$\frac{\partial^2 u}{\partial x^2}$	$\frac{^2u}{x^2}$	$\frac{\partial^2 u}{\partial x^2}$	$\dfracpartial {^2u} {x^2}$
$\frac{\partial}{\partial x}$	\fracpartials{x}	$\frac{\partial}{\partial x}$	\dfracpartials{x}

- Function vaules at exact point. Command: \mfwhen{var1}{var2}. var1 and var2 is function and point position, respectively. For example, \mfwhen{\fracpartial{u}{t}}{x=5} gets $\frac{\partial u}{\partial t}|_{x=5}$.
- Auto sized brackets. Command: \mclosure{} for (), \mclosuresquare{} for [], \mclosurebrace{} for {}. For example, $\left\{\left[\left(a^2+b^2\right)^2\right]^3\right\}$.
- Vector(Sequence) generator. Command \mvct[z][t]{var1}{var2}. var1 and var2 is variable name and the last index, respectively. The index is begin from 1 in default. [z] makes index begins from 0. [t] makes this vector transposed into a column vector. For example,

Text	T_EX	Text	T _E X
(a_1, a_2, \dots, a_n) $(a_1, a_2, \dots, a_n)^{\mathrm{T}}$		(a_0, a_1, \dots, a_n) $(a_0, a_1, \dots, a_n)^{\mathrm{T}}$	\mvctz{a}{n} \mvctzt{a}{n}

• A list of equations group by a brace. Command \mequlist{\ldots\}. Also provide environment equlist, which is similar with the cases environment. For example, \mequlist{x + y &= 10 \\ 4x + 2y &= 30} \\ 4x + 2y = 30.
